## Research interests

---

I am a computational cognitive neuroscientist interested in the conscious experience of inner speech and its neural underpinnings. My research combines experimental (e.g., psychophysics, EMG, M/EEG, TMS) and computational (e.g., mathematical modelling, artificial neural networks) methods to understand how complex patterns of neural activity give rise to algorithms supporting the mental simulation of speech (inner speech). In parallel, I also work on the development and dissemination of rigorous experimental and statistical methods.
